

SQL Injection – UNION Attack: Retrieving Data from Other Tables

Lab

PortSwigger Web Security Academy

Vulnerability

SQL Injection (UNION-based)

Objective

Use a UNION-based SQL injection to retrieve data from another database table.

Methodology

1. Identified the vulnerable parameter.
2. Determined the number of columns returned by the original query.
3. Used **UNION SELECT** to query another table.
4. Retrieved the required data from the target table.
5. Successfully completed the lab.

Example Payload

```
' UNION SELECT username,password FROM users--
```

The exact payload depends on the database structure and the number of columns returned by the original query.

Impact

An attacker may use UNION-based SQL injection to access sensitive information stored in other database tables, including usernames and passwords.

OWASP

OWASP Top 10 – A03:2021 Injection

Result

Successfully retrieved data from another database table and solved the PortSwigger lab.
